Gene Summary	Transcription factor that represses the transcription of a wide range of genes involved in cell proliferation and differentiation (PubMed:14701838, PubMed:17595526, PubMed:20812024, PubMed:25514493, PubMed:26455326, PubMed:26816381). Directly and specifically binds to the consensus sequence 5'-GACCCCCCCC-3' and represses transcription both by regulating the organization of chromatin and through the direct recruitment of transcription factors to gene regulatory regions (PubMed:12004059, PubMed:17595526, PubMed:20812024, PubMed:25514493, PubMed:26816381). Negatively regulates SMAD4 transcriptional activity in the TGF-beta signaling pathway through these two mechanisms (PubMed:25514493). That is, recruits the chromatin regulator HDAC1 to the SMAD4-DNA complex and in parallel prevents the recruitment of the transcriptional activators CREBBP and EP300 (PubMed:25514493). Collaborates with transcription factors like RELA to modify the accessibility of gene transcription regulatory regions to secondary transcription factors (By similarity). Also directly interacts with transcription factors like SP1 to prevent their binding to DNA (PubMed:12004059). Functions as an androgen receptor/AR transcriptional corepressor by recruiting NCOR1 and NCOR2 to the androgen response elements/ARE on target genes (PubMed:20812024). Thereby, negatively regulates

	androgen receptor signaling and androgen-induced cell proliferation (PubMed:20812024). Involved in the switch between fetal and adult globin expression during erythroid cells maturation (PubMed:26816381). Through its interaction with the NuRD complex regulates chromatin at the fetal globin genes to repress their transcription (PubMed:26816381). Specifically represses the transcription of the tumor suppressor ARF isoform from the CDKN2A gene (By similarity). Efficiently abrogates E2F1-dependent CDKN2A transactivation (By similarity). Regulates chondrogenesis through the transcriptional repression of specific genes via a mechanism that also requires histone deacetylation (By similarity). Regulates cell proliferation through the transcriptional regulation of genes involved in glycolysis (PubMed:26455326). Involved in adipogenesis through the regulation of genes involved in adipocyte differentiation (PubMed:14701838). Plays a key role in the differentiation of lymphoid progenitors into B and T lineages (By similarity). Promotes differentiation towards the B lineage by inhibiting the T-cell instructive Notch signaling pathway through the specific transcriptional repression of Notch downstream target genes (By similarity). Also regulates osteoclast differentiation (By similarity). May also play a role, independently of its transcriptional activity, in double-strand break repair via classical non-homologous end joining/cNHEJ (By similarity). Recruited to double-strand break sites on damage DNA, interacts with the DNA-dependent protein kinase complex and directly regulates its stability and activity in DNA repair (By similarity). May also modulate the splicing activity of KHDRBS1 toward BCL2L1 in a mechanism which is histone deacetylase-dependent and thereby negatively regulates the pro-apoptotic effect of KHDRBS1 (PubMed:24514149). 使用说明：

1. 慢病毒感染：

- a. 确定puromycin的筛选浓度：待感染的细胞按一定密度铺在12孔或24孔中，按照0、0.2、0.5、1、1.5、2、3、4、5μg/ml这样的浓度测试细胞对puromycin的敏感性，推荐使用碧云天的Puromycin Dihydrochloride (嘌呤霉素) (ST551)。两天后细胞全部死亡的最低浓度即为该细胞的puromycin筛选浓度，具体步骤参考碧云天该产品的使用说明：<https://www.beyotime.com/product/ST551-10mg.htm>
- b. 慢病毒感染细胞：按实验需要将细胞铺板(如12孔板)，细胞数以第2天密度约50%为宜。设置非感染细胞组、对照组和基因敲除组。37°C培养过夜后，培养液中加入5~10μg/ml的Polybrene (C0351/ST551)。病毒感染前，从-80°C冰箱取出病毒后冰浴融化，参考相关文献或者根据预实验得到的MOI值加入适量病毒，对于未浓缩的病毒，可以直接按0.5ml/孔加入细胞，对于浓缩或测定滴度的病毒，一般100μl/孔或10⁷ TU已经足够，轻轻摇匀，37°C继续培养。两天后，吸除含病毒的培养液，换为新鲜的含一定浓度的puromycin的培养液进行筛选，一般筛选2天后，非感染细胞组细胞逐渐死去，加入病毒组存活率比较高，就可以收集部分细胞检测目的蛋白的表达或进行其它实验。培养过程中，可以将细胞转至6孔板或10cm培养皿进行扩大培养。一周之后，puromycin浓度可减半。如果有必要后续可以通过将细胞稀释至2.5个/ml，然后按照每孔200μl接种到96孔板中(每孔平均0.5个细胞)，筛选单克隆细胞株。病毒感染的方法可参考Polybrene (C0351)的使用说明<https://www.beyotime.com/product/C0351-1ml.htm>

2. 基因编辑的鉴定：

- a. 对于多克隆细胞，可以通过T7 Endonuclease I (T7EI)进行鉴定，即提取细胞的基因组DNA，在sgRNA序列两边设计引物进行PCR扩增，然后进行T7EI酶切，具体请参考碧云天的T7 Endonuclease I (CRISPR等基因突变鉴定用) (D7080)或基因组编辑突变检测试剂盒(D0508)；也可以通过相应的抗体进行检测。
- b. 对于单克隆细胞，可通过PCR扩增出sgRNA靶向的基因片段后进行常规测序的方式进行验证，同时也可使用相应的抗体进行检测。
